

The document DE 3727417 describes merely in general a method for producing a mixture of mineral substances for dietetic or pharmaceutical purposes, in which biological-organic raw materials are reduced to their mineral content by incineration. The document has been referred to in the International report on patentability with respect to using ash as a raw material (compare issue 4.4), which according to our point of view, however, is not mentioned in DE 3727417 at all.
